

Customized solutions for washing units

Franke Aquarotter will be presenting more of their comfortable washbasin solutions for the Airbus A380 (6C29). The various product solutions were designed in response to specific customer requirements of several international airlines, and were driven by special spatial and installation conditions in the individual lavatory modules. In addition to the standard solutions, these optimized customer variations will be applied in the Business and First Class lavatories. Changes such as other surfaces or outlet lengths are only externally visible.

The user-friendly labelled wall mounted faucets, which facilitate easy temperature selection by means of two touch sensors and an LED temperature display. A separately controlled electromechanical thermostat maintains the required water temperature and at the same time provides safety against scalding by keeping the temperature at a maximum of 40°C. The flow of water is triggered by an opto-electronic user sensor. The faucet facilitates a water consumption of only 1.5 litres per minute. An energy-efficient heater ensures there is always hot water available.

Thanks to the integrated controller, which continuously monitors the faucet functions, it is now for the first time also possible to have real-time monitoring of the fresh-water system within every lavatory.
